

Skin Rejuvenation

When skin cells are traumatised by acne or an injury, scar tissue can form deep beneath the surface, affecting the overall appearance of the skin.

These cells are densely packed and lack the elasticity of regular cells, resulting in the pocked or knotted look we associate with scarring. The DermaPen works by penetrating the outer layer of skin to pierce these dense strings of cells with sharp microneedles.

This minor, focussed damage breaks them up, stimulating an immune response that triggers the healing process to begin anew and encouraging a smoother result.

The DermaPen is safe and effective when handled by a clinician trained in its use.

This innovative new technology in skin aesthetics and beauty has different depth settings, making it suitable for all areas of the face.
